The Original High Pressure Laminate by Formica Group Formica® Brand Laminate offers a wider range of Looks than ever. Transform spaces with our modern laminates that are as beautiful as durable. Mix and combine solids, graphic patterns and finishes. Get the look you want for any challenge of designer or budget. See colors See video See photo gallery. Next look! The colonies that we sell are mainly colonies with queens, instead of only workers' ants. What is different is that these colonies are capable of growing and living during years instead of months. The majority of our ants are actually pre-sculpted, so they do not have excavation and additional visibility, since You can see the internal operation of the entire colony. Each year, adult colonies will release queens and males in what is called a "Bridal flight." The queens and males take the air and move (in the photo, by Braeden Hallett). Reinas land on the ground, and for most species, they dig a hole called a "Cleustral lamb" on the ground or on the wood, where they put their eggs and slowly raise their first breeding of workers. In captivity, we replied This stage with a test tube, which has water on one side to maintain moisture, and space at the other end after any 4-6 weeks, the first group of workers begins to hatch. These workers usually feed only with the queen's fat reserves, so they leave much more small, and they are known as "Naniticsá". In this stage, the colony will begin to forage, and can Feeding very small quantities of food every few days (most often is better). Many people ask when they can take out the specimen colony, they can tear a few months in the specimen. And in general, it depends on the size, but normally you should be able to do it once they can fill 20% of the Nido chambers. To Lo. of the year, the colony will lay eggs continuously and gain new workers. Some ways to speed this up are:- Heat (Can accelerate growth growth growth 2 months to 4 weeks from the egg to the worker) - Frequent feeds (Ideally Azúcar must be provided): Varied foods (all the insect, sometimes even seeds or processed meats) around the winter, most species will enter In hibernation. When it arrives this time, they can be placed in the fridge or in the garage (we use a wine cooler) about 5 degrees Celsius. In general, they are maintained in this way for 3-4 months before production can be returned. Production (eggs, larvae, pupae) stops for most species during this time (exceptions include APHAEngaster, MyRMica (Fire Horn), Temnothorax (Bellota Ants), Tetramorium (pavement ants)) Subsequently, the ants can be removed, and growth will continue as normal, take the time to review the portal and beginner guides. It will help you enormously. By Jill Sutton On November 1, 2018, the verified purchase really can not say enough about the good things about the door of the door we ordered. I could not be more happy with our selection! The negative only I can say is that it was difficult to obtain the protective coating of the clear acrylic plaques. I had to soak up in water to come out. There were no instructions on how to eliminate them and there was no easy pull tab to take them easily. Then, 2 of the transparent acrylic plates did not have the protective coating on both sides (it only had it on one side), but it had the white ribbon on both sides. What was difficult to eliminate (even more difficult to lower, then the protective cover / coating). Wilsonart, a leader of leader surfaces leader in the world, is driven by a mission to create surfaces to people who love, with the service where they can count, delivered by people who care. The company manufactures and distributes a laminate of Pressure, quartz, Siluted surface, coordinated TFL and Edgeband, and other decorative engineering surfaces for use in the office, education, medical, residential, hospitality and retail markets.
