CCNA 2 (v5.0.3 + v6.0) Chapter 9 Exam Answers 2017 - 100% Full

- Which three statements describe ACL processing of packets? (Choose three.)
  - An implicit deny any rejects any packet that does not match any ACE.
  - A packet can either be rejected or forwarded as directed by the ACE that is matched.
  - A packet that has been denied by one ACE can be permitted by a subsequent ACE.
  - A packet that does not match the conditions of any ACE will be forwarded by default.
  - Each statement is checked only until a match is detected or until the end of the ACE list.
  - Each packet is compared to the conditions of every ACE in the ACL before a forwarding decision is made.
- What two functions describe uses of an access control list? (Choose two.)
  - ACLs assist the router in determining the best path to a destination.
  - Standard ACLs can restrict access to specific applications and ports.
  - ACLs provide a basic level of security for network access.
  - ACLs can permit or deny traffic based upon the MAC address originating on the router.
  - ACLs can control which areas a host can access on a network.
- In which configuration would an outbound ACL placement be preferred over an inbound ACL placement?
  - when the ACL is applied to an outbound interface to filter packets coming from multiple inbound interfaces before the packets exit the interface
  - when a router has more than one ACL
  - when an outbound ACL is closer to the source of the traffic flow
  - when an interface is filtered by an outbound ACL and the network attached to the interface is the source network being filtered within the ACL
- Which two characteristics are shared by both standard and extended ACLs? (Choose two.)
  - Both kinds of ACLs can filter based on protocol type.
  - Both can permit or deny specific services by port number.
  - Both include an implicit deny as a final entry.
  - Both filter packets for a specific destination host IP address.
  - Both can be created by using either a descriptive name or number.
- A network administrator needs to configure a standard ACL so that only the workstation of the administrator with the IP address 192.168.15.23 can access the virtual terminal of the main router. Which two configuration commands can achieve the task? (Choose two.)
  - Router1(config)# access-list 10 permit host 192.168.15.23 \*
  - Router1(config)# access-list 10 permit 192.168.15.23 0.0.0.0
  - Router1(config)# access-list 10 permit 192.168.15.23 0.0.0.255
  - Router1(config)# access-list 10 permit 192.168.15.23 255.255.255.0
  - Router1(config)# access-list 10 permit 192.168.15.23 255.255.255.255
- What single access list statement matches all of the following networks? 192.168.16.0
