The modern webdeveloper platform The modern webdeveloper platform By Arvind Rai, April 29, 2019 This page will go through the option of angular selecting + opinion of multiple-type seler + validation example using the Reactive Form. We will provide an end-to-end demonstration of how to fill in the selected option and selected options. In Angular select element, the value attribute of element can bind an object using property binding. For selected element validation, we need to use the validation attribute as required as the selected element attribute or Validators.required in FormControl. Select ing element © written using tag, and multiple select elements use multiple attributes such as . By default, the selected element comcants two objects using the object's identity. If we want to change the default behavior, we need to use the comparisonWith input in selected element. Now find the full example step by step. Content Find the technologies that are being used in our example. 1. Angular 7.0.0 2. Angular CLI 7.0.3 3. TypeScript 3.1.1 4. No.js 10.3.0 5. NPM 6.1.0 Let's create a FormGroup using FormBuilder. useForm: FormGroup; this.userForm = this.formBuilder.group({ profile: [null, [Validators.required]], userName: [' ', [Validators.required] technologies: [null, [Validators.required]]}); In the above form, the profile form control will be used for a second dropdown selection and the technology form control will be used for multiple selection options in our demonstration. This directive works for both FormsModule and ReactiveFormsModule. Find the steps to the element for single design. Step-1: Import ReactiveFormsModule Imported metadata of @NgModule decorator in the application method. Step-2: Create a data set that will be displayed in dropdown. For example, we created a class to store data. export class Profile {constructor(public prId:string, public pr:string) {Now Now Now Now a profile class matrix. AllProfiles = [new profile ('Dev', 'develop'), new profile ('man', 'man'), new profile ('direct', 'direct')] Step-3: Find the element . Here we will iterate our array boards to fill data in drop-down list. To assign value to the option element, we need to use the NGVALUE property. We can assign our object to ngvalue using the property connection. Find the code snippet to use the element. Choose your profile {PRF. }
